ALL TIME GREATS

1. Overview

ALL TIME GREATS is a specialized radio scheduling application designed for a "Tight Playlist" format. It generates a 16-track (60-minute) playlist using a highly curated database of only 158 songs.

2. Data Source & Heritage

The library is exclusively comprised of songs that achieved a "Top 40" position in the National Hospital Radio Request Charts. This chart was established in 2004 to track the most requested songs across the hospital radio network. By using only these 158 "All Time Greats," the system ensures maximum listener engagement and familiarity.

3. System Logic & Data Mapping

The application connects to the master database (Scored_Hospital_Radio_Data.csv) and processes the following columns:

- Column A: Artist Name
- Column B: Song Title
- Column AA: Average Score (Decimal format, e.g., 22.50)
- Column AB: Artist Gender
- Column AC: Release Year

4. Anti-Clumping Rules

To maintain professional broadcast standards within a small library, the system applies the following logic:

- Artist Protection: Prevents the same artist from appearing twice in the same hour.
- Gender Balancing: Prevents three consecutive tracks of the same artist gender (Column AB).
- Era Monitors Column AC to ensure a consistent mix of tracks from across the 20-year history.
- Quality Weighting: Uses Column AA scores to prioritize the highest-rated requested tracks.

5. How to Use

1. Access the Portal: https://tonywilding33.github.io/ALLTIMEGREATS/
2. Generate: The playlist generates automatically upon page load.
3. Format: Output is displayed as: 01 ARTIST Song Title.
4. Export: Click "Download Playlist (.txt)" to save the log.

5. New Show: Refresh the browser to generate a new randomized selection.
